

Wine Club v1.0.9 Update

We've released Wine Club v1.0.9 focuses on fixes and improvements designed to make club management more reliable, from building shipments and managing subscription billing to reporting and spreadsheet uploads. See below for what is new and improved!

Smoother Club Shipment Building

- Every member now appears on step 3 of a shipment build, even when Wine Club cannot find an available shipping option for them.
- Previously, some members could be counted in the build without appearing on step 3, preventing wineries from moving forward without showing who was causing the issue. Now, those members will appear in the Needs Attention list with a clear explanation, so you can fix or remove them and continue your build.
- We also improved how Wine Club handles shipping options. If the shipping method selected for the build is not available for a member, Wine Club will automatically select that member's cheapest available shipping method. It will only fall back to a pickup option when no shipping methods are available.
- Warning messages are clearer, too. Shipping builds will now display "No Shipping Method Selected" when nothing has been selected, while "No Pickup Methods Selected" is reserved for pickup builds and pickup members.

More Accurate Subscription Billing Dates

We fixed several issues that could cause subscription members to display an incorrect next billing date.

- Declined payments now keep the correct retry date. If a member's card declines, their membership will show the current billing date marked "current - past due" rather than incorrectly moving the date to the same month the following year.
- New members now show the correct first billing date. If a member has not been billed yet, their membership will display the club's next upcoming billing date, including when that date falls later in the current month.
- Editing a membership will no longer change the billing month. The billing date picker now matches the actual billing date, helping ensure the correct date stays in place when a membership is opened, edited, and saved.
- Blank billing dates are prevented. A membership can no longer be saved without a selected billing date in a way that creates an empty billing record and causes problems during renewal processing.

Wine Club v1.0.9 Update

More Reliable Retry Batch Reporting

- Retry batch reporting has also been improved. If a retry batch happens to run more than once, such as after a server restart, the members included in that batch will still appear correctly in the batch report.
- This gives your team a more reliable record of subscription billing and retry activity.

Safer Spreadsheet Uploads

- The Import Preferences and Import Wishlists tabs now check every uploaded file before it is saved.
- Wine Club will accept supported spreadsheet formats, including .xlsx, .xls, and .csv, while preventing unsupported file types from being uploaded.
- If you are already using standard spreadsheets for these imports, nothing about your normal workflow changes.

Additional Reliability Improvements

We also made several improvements behind the scenes to keep Wine Club running smoothly.

- Bottle-count processes that happen at the same time are now less likely to interfere with one another and cause errors.
- We also added more than 1,800 lines of automated testing covering shipping options, subscription billing, batch reports, and club settings. This expanded testing helps us catch potential issues earlier and improve the reliability of future Wine Club releases.

These updates are designed to give your team greater confidence when building shipments, managing subscription memberships, and reviewing club activity.

As always, the OrderPort team will continue refining Wine Club based on real-world feedback from the wineries using it every day.
